ARBEITSVORHABEN

Plastizität, Robustheit und Adaptation in Dauerstadien bei Nematoden

In this proposed Wiko fellowship I will study the dauer decision in *C. elegans* as an example of phenotypic plasticity. Specifically, in collaboration with Mark Viney and other members of the Adaptive Plasticity working group, I will develop a computational model of the dauer decision in *C. elegans*, to investigate three key questions:

- 1) Why do rates of dauer formation differ between different worm genotypes?
- 2) How does the network structure of the dauer pathway affect the phenotypic plasticity response?
- 3) Is the *C. elegans* dauer pathway fundamentally different in structure from pathways underlying programmed development?
